

Software Architect
Billerica MA

Job Description:

We are looking for a software engineer to guide the development of solutions for customer management and Operations logistics. The Software Architect will be involved in feature development as it relates to defining the direction of Walden's data architecture: deriving design constraints from business and technical requirements, technology selection, design, and implementation. While the primary focus of this role is strategic, given the small size of our development team this role will require at least 30% of time devoted to hands-on implementation. This role is based in our warehouse office in Billerica, MA.

Responsibilities

- Report to Walden's Lead Systems Engineer and manage projects for a small team of devs.
- Develop a complete understanding of technical assets, Operations workflows, and business requirements
- Take ownership of Walden's data architecture and APIs, in particular how they interface with external systems
- Guide software projects from high-level user stories through deployment, testing, and long term support
- Serve as the subject matter expert for solution architecture that will include internal development and a large amount of 3rd party software integration
- Manage relationships with software consultants and other third parties

Requirements

- 5 years of industry experience with software development in Java, JavaScript, relational databases, complex data analysis, debugging, and version control
- Demonstrated experience collaborating across company functions including customer experience, operations, and senior management
- Understanding of operation logistics and processes
- Willingness to jump in and get dirty outside of job role to further team and member experience

Interested candidates should submit a cover letter and resume to jobs@waldenlocalmeat.com
